FUSECON 2026

X-Factory.

Developing with Purpose:
How AI Changed Product Development, Not Just Coding

October 2026

WE KNOW THAT

coding is no longer the bottleneck.

The hard part is now deciding what to build, reviewing what was built and proving it works.

Build is no longer the constraint.

Before agents · every stage runs at human speed

After agents · build runs at agent speed

AI agents already run many parts of Deriv

Meet a few of them: a small fraction of the agents we run today.

THE PROBLEM

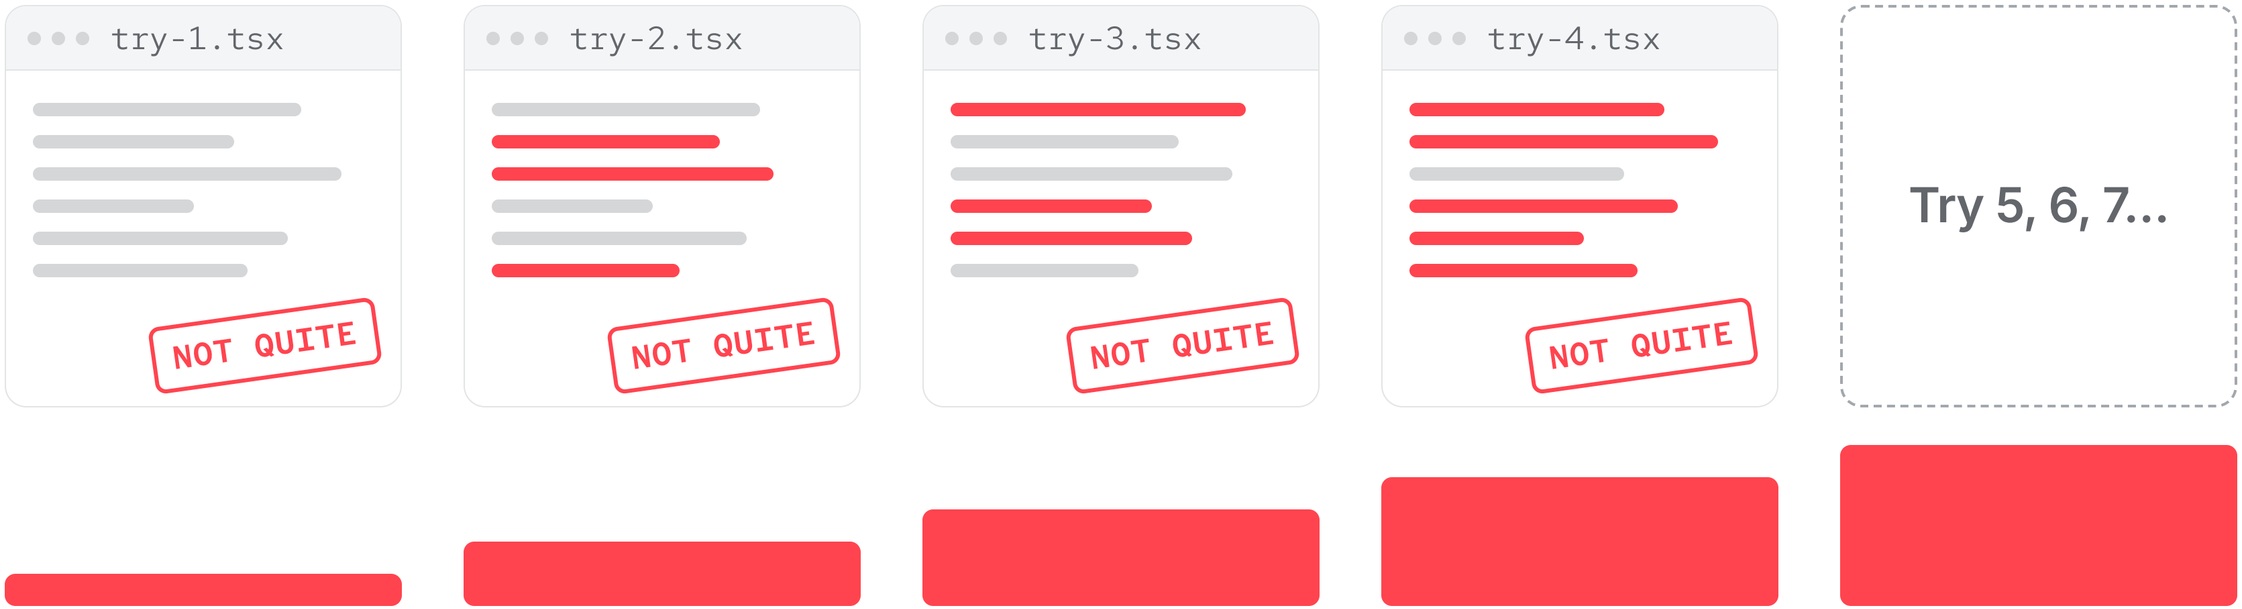

Building with AI looks cheap. It isn’t.

WHAT WE ASSUME	WHAT IT REALLY COSTS
~~A prototype is one prompt away~~	Many rounds, each burning tokens and review time
~~Changing it in code is quick~~	Every design change in code is another rebuild
~~The demo is almost the product~~	Demos skip real data, so they get rebuilt for production

THE PROBLEM · 01

Every change is another rewrite.

Iterating in code burns tokens and review time, round after round.

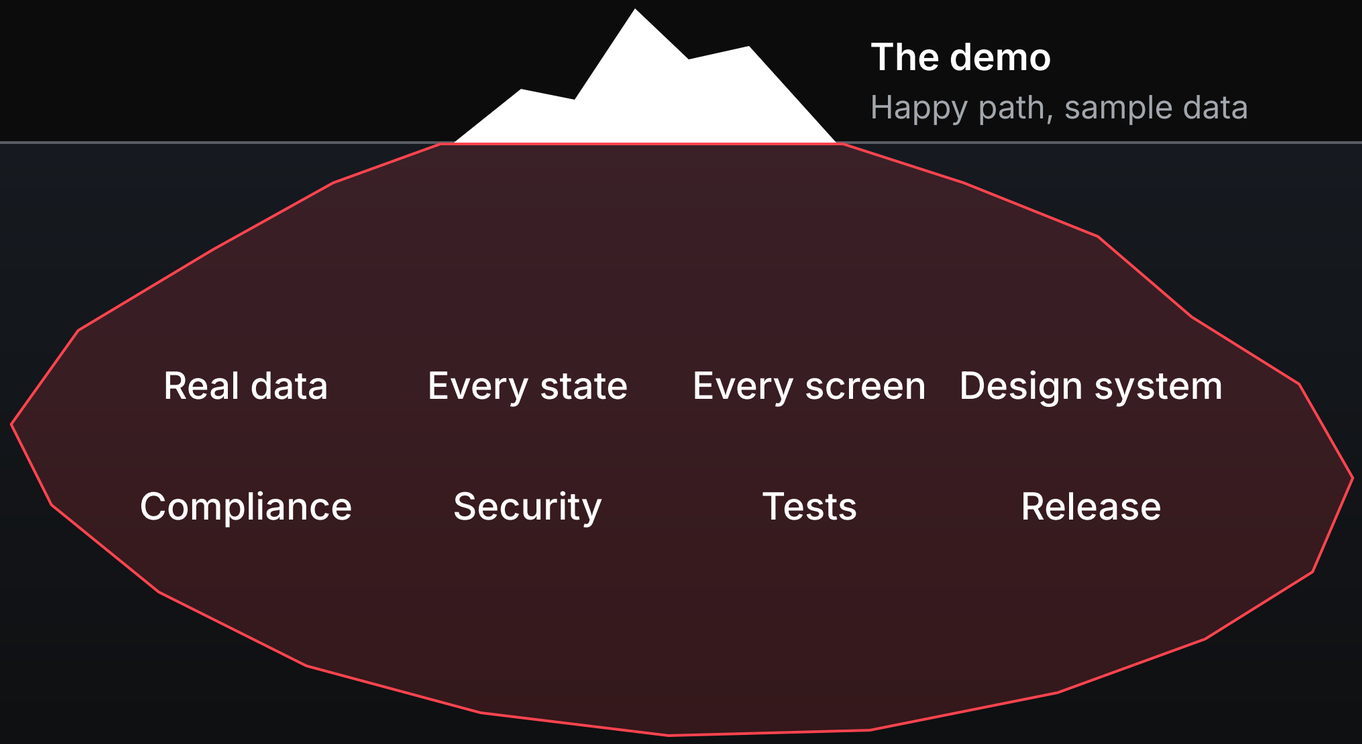

COST: TOKENS + REVIEW TIME, AND CLIMBING

The demo is just the tip.
Production is everything underneath.

WHAT YOU SEE

The demo
Happy path, sample data

WHAT IT TAKES

Five stages to a shipped MVP.

Each stage commits a document the next one reads.

01

Plan

`idea.md → mvp.md`

The MVP, in writing

02

Design

`mockup .md + .html`

Iterate until it’s right

03

Build & test

`code + tests`

AI subagents

04

Ship

`pull request`

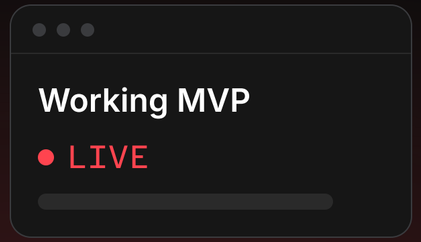

MVP, then features

05

Maintain

`findings`

AI Maintenance Agent

01

Iterate the design

Every round happens on a mockup built from real APIs and our design system. A change takes minutes, not a rebuild.

SOLVES PROBLEM 01

Many rounds burning tokens

Every design change becoming a rebuild

02

Ship the MVP first

One core flow, end to end, live on real data. Every feature after it lands on a working product.

SOLVES PROBLEM 02

Demos that skip real data

Prototypes rebuilt for production

Cheaper.

We iterate on mockups, where a change costs minutes and few tokens. Code is written once.

Faster.

A working MVP ships first. AI agents build, test, review and release every feature after it.

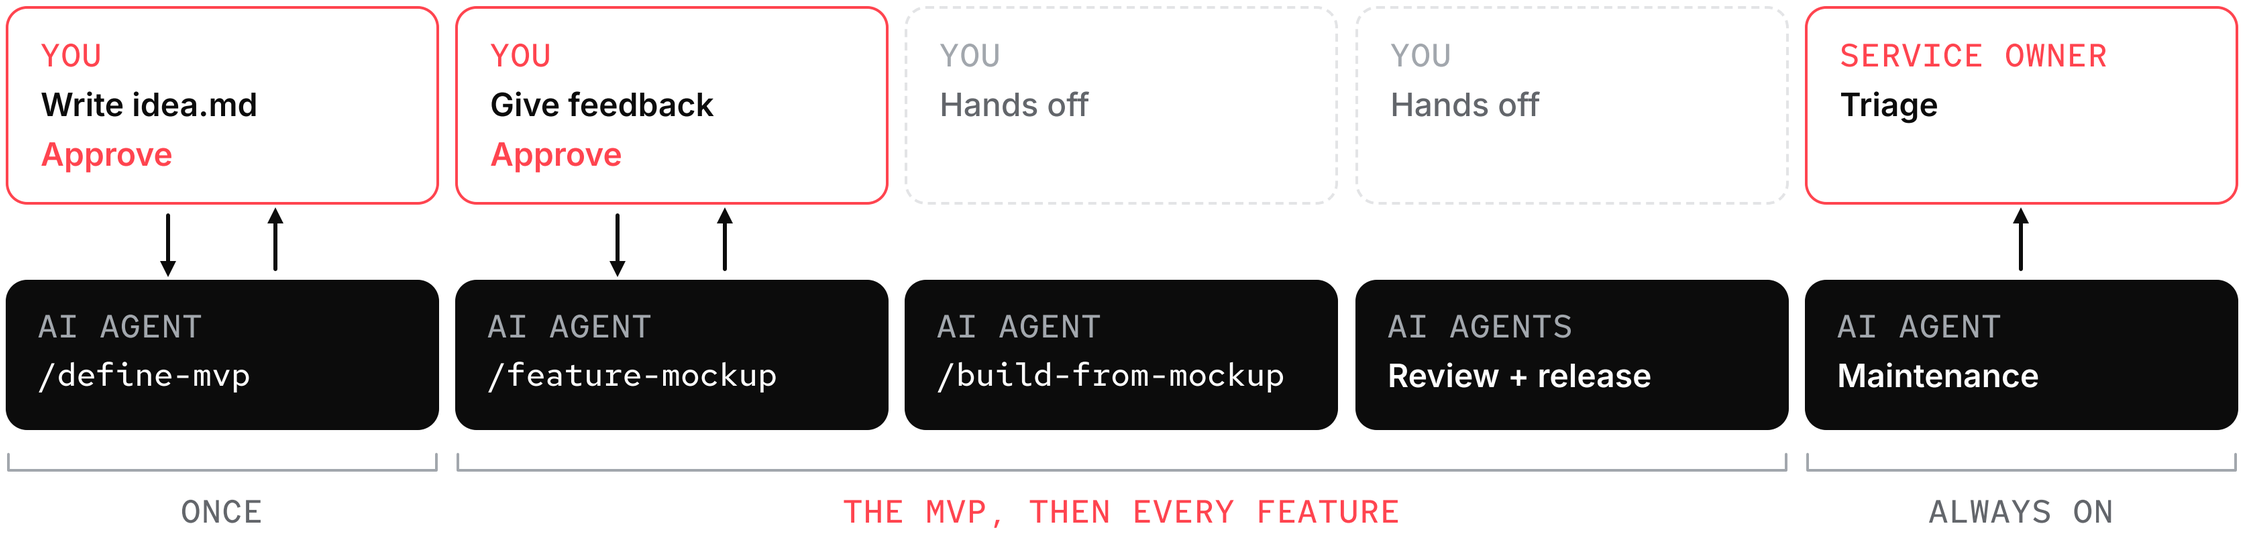

More accurate.

Every feature runs on real data and matches the design we approved.

01 Plan | 02 Design | 03 Build & test | 04 Review & ship | 05 Maintain

Let’s talk about the process.

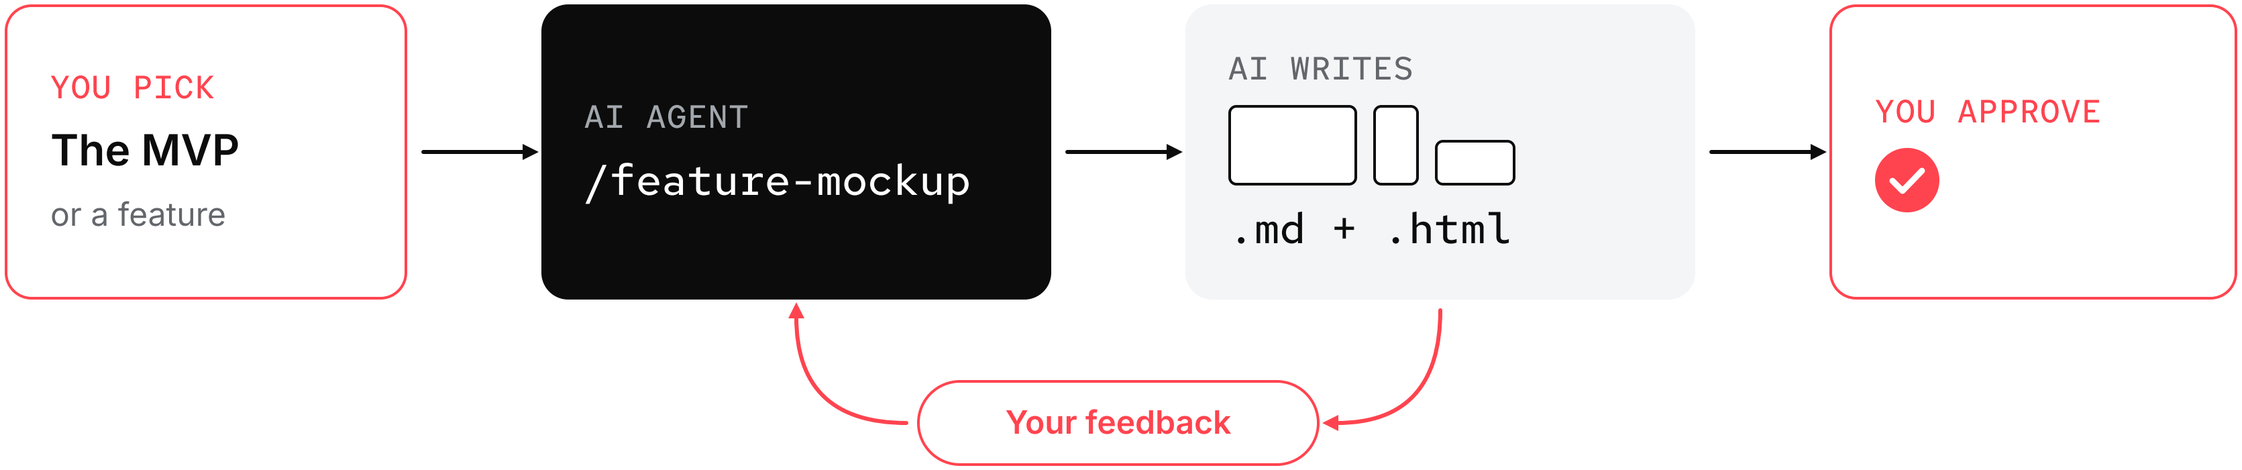

Three commands. Two approvals.

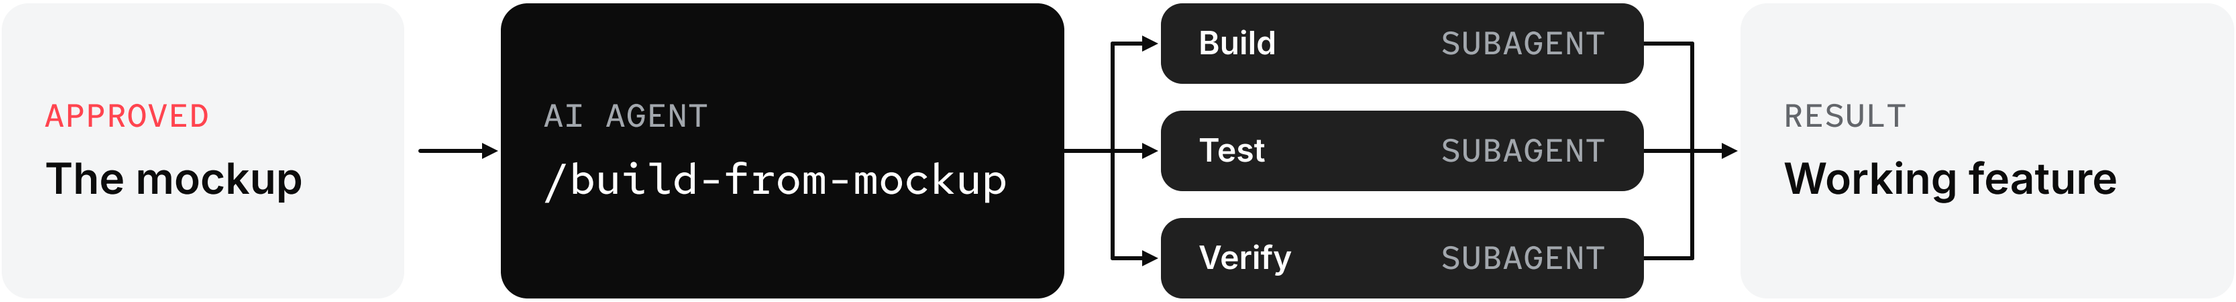

Turn the idea into an MVP.

Iterate on the mockup, not the code.

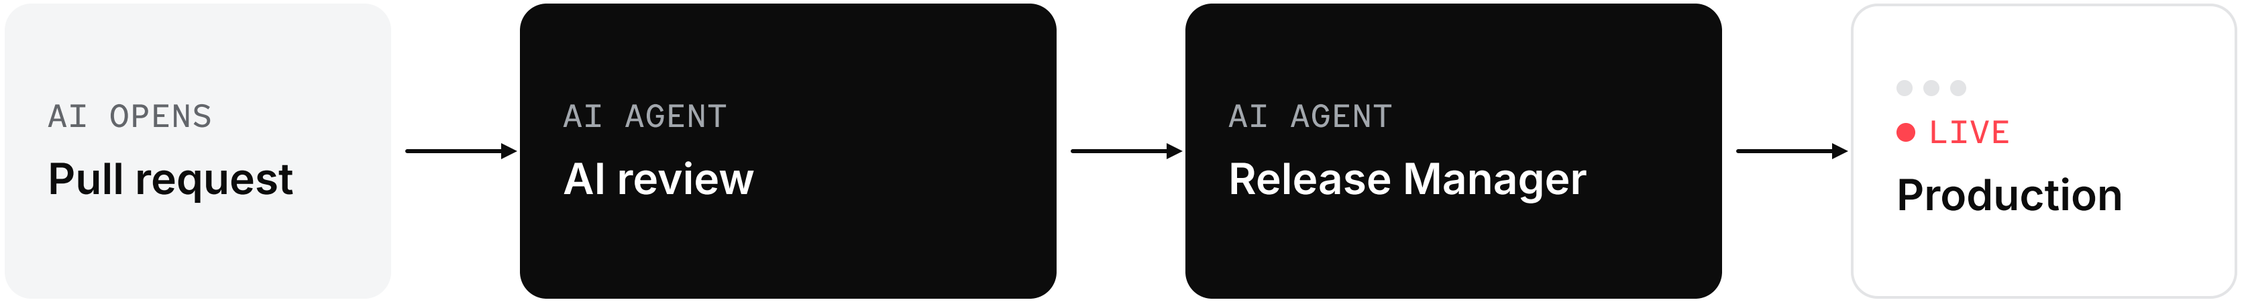

Build and test in one step.

No evidence, no review.

AI reviews. AI releases.

AI looks after it in production.

LIVE DEMO

Let’s build one.

On to the workshop: from an idea to a shipped MVP with X-Factory.

`/define-mvp` → `/feature-mockup` → `/build-from-mockup`

Q&A

Thank you.
